**EP 0 689 872 B1**

**Description****Background of the Invention**

5 [0001] This invention relates to a process for selectively hydrogenating acetylene to ethylene employing supported palladium/silver catalysts having been prepared by the preparation method of this invention.

[0002] The selective hydrogenation of acetylene being present as an impurity in monoolefin-containing streams (e. g., ethylene streams from thermal ethane crackers) is commercially carried out with an alumina-supported palladium/silver catalyst, substantially in accordance with the disclosure in U.S. Patent 4,404,124 and its division, U.S. Patent 10 4,484,015. The operating temperature for this process is selected such that essentially all acetylene is hydrogenated to ethylene (and thus removed from the feed stream) while only an insignificant amount of ethylene is hydrogenated to ethane (to minimize ethylene losses and to avoid a "runaway" reaction which is difficult to control, as has been pointed out in the above-identified patents). The selective acetylene hydrogenation process can be most effectively controlled when there is a large difference between the temperature at which essentially all acetylene is hydrogenated 15 and a higher temperature at which excessive ethylene-to-ethane conversion occurs. Even though the Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalyst described in the above-identified patents is an excellent catalyst, the present invention represents an improvement in the preparation of this catalyst and related catalysts and their use for the selective acetylene hydrogenation.

**Summary of the Invention**

20 [0003] It is an object of this invention to carry out the selective hydrogenation of acetylene to ethylene in the presence of improved palladium/silver catalysts. It is a further object of this invention to employ these improved catalysts for hydrogenating acetylene which is present in small amounts in ethylene-containing streams. Other objects and advantages will be apparent from the detailed description and appended claims.

25 [0004] In accordance with this invention, a preparation method for the catalysts to be employed according to the present invention comprises contacting a solid composition (also referred to as "base catalyst composition" or "starting catalyst composition") comprising palladium, silver and an inorganic support material with a liquid composition comprising at least one effective reducing agent at a temperature of up to about 60°C, at contacting conditions which are effective in enhancing the selectivity of said solid catalyst composition when employed as a catalyst for hydrogenating 30 acetylene to ethylene. In a preferred embodiment, said contacting is carried out with a reducing agent in the presence of at least one alkali metal compound, more preferably an alkali metal hydroxide and/or an alkali metal fluoride.

[0005] In one specific embodiment, the starting catalyst composition is reduced with a solution of an alkali metal borohydride, dried and then heated (preferably in an oxidizing gas atmosphere) at a temperature in the range of about 300°C to about 700°C for at least about 10 minutes. In another specific embodiment, the starting catalyst composition 35 is reduced with a solution of hydrazine and dried, and, optionally, thereafter heated (preferably in an oxidizing gas atmosphere) at a temperature in the range of about 300°C to about 700°C for at least about 10 minutes. In a further specific embodiment, the starting catalyst composition is reduced with a solution containing formaldehyde and/or alkali metal fluoride and at least one alkali metal hydroxide and dried and, preferably, thereafter heated (preferably in an oxidizing gas atmosphere) at a temperature in the range of about 300°C to about 700°C for at least about 10 minutes. 40 In still another specific embodiment, the starting catalyst composition is reduced with a solution containing dextrose, and at least one alkali metal hydroxide, dried and thereafter heated (preferably in an oxidizing gas atmosphere) at a temperature of about 300°C to about 700°C for at least about 10 minutes.

[0006] In accordance with this invention, a process for selectively hydrogenating acetylene (preferably present in a small amount in an ethylene-containing gas stream) with hydrogen gas to ethylene is carried out with a catalyst prepared 45 by one of the above described methods of this invention.

**Detailed Description of the Invention**

50 [0007] The starting material (also referred to as "base catalyst") which is wet-reduced can be any supported palladium- and silver-containing catalyst composition. This catalyst composition can be fresh (e.g., supplied by United Catalysts, Inc., Louisville, KY, under the product designation of "G-83C") or it can be a used and thereafter oxidatively regenerated catalyst composition. The base catalyst can contain any suitable solid support material. Preferably, the support material is selected from the group consisting of alumina (more preferably alpha-alumina), titania, zirconia and mixtures thereof. Presently most preferred is the palladium/silver/alumina composition described in U.S. Patent 55 4,404,124, the disclosure of which is incorporated herein by reference. This skin-type catalyst generally contains about 0.01-1 (preferably about 0.01-0.2) weight-% palladium and about 0.01-10 (preferably about 0.02-2) weight-% silver, at a Ag:Pd weight ratio of about 1:1 to about 10:1, more preferably about 5:1 to about 8:1. The particle size of the supported Pd/Ag base catalyst generally is about 1-10 mm, most preferably 2-6 mm. The supported Pd/Ag base catalyst particles

can have any suitable shape, and preferably are spheres or cylindrical pellets. Generally, the surface area of the supported Pd/Ag base catalyst (determined by the BET method employing  $N_2$ ) is about 1-100  $m^2/g$ .

**[0008]** The above-described base catalyst particles are contacted with a reduction composition (hereinafter referred to as "wet-reduction composition"), which contains at least one reducing agent and, if the reducing agent is not liquid, also at least one liquid component, in accordance with this invention. Suitable reducing agents include (but are not limited to) alkali metal borohydrides (such as  $NaBH_4$ ,  $KBH_4$ ), hydrazine, aldehydes containing 1-6 carbon atoms per molecule (preferably formaldehyde), ketones containing 1-6 carbon atoms per molecule, carboxylic acids containing 1-6 carbon atoms per molecule (preferably, formic acid, ascorbic acid), reducing sugars which contain an aldehyde group or, alternatively, an  $\alpha$ -hydroxyketone group (preferably dextrose), aluminum metal (preferably powder), zinc metal (preferably powder), and the like, and mixtures thereof. In the case of the above-listed aldehydes, ketones, carboxylic acids, reducing sugars, zinc metal, and aluminum metal, these reducing agents are most effective when an alkaline agent (preferably an alkali metal hydroxide and/or fluoride) is also present in the wet-reduction composition. When the reducing agent is a solid (e.g., Al powder), a liquid substance which functions as a solvent or, alternatively, as a dispersing medium is also present in the wet-reduction composition. Water or a lower aliphatic alcohol (in particular methanol), or mixtures thereof can serve as the non-reducing liquid component. Generally, the weight percentage of the at least one reducing agent in the wet reduction composition is in the range of about 0.5 to about 50 weight-%, but may be even higher. Preferably, the pH of the wet-reduction composition, in particular if it is aqueous, is about 8-14.

**[0009]** The wet-reduction composition can additionally contain at least one dissolved compound of at least one alkali metal (preferably selected from the group consisting of potassium, rubidium and cesium). Presently preferred alkali metal compounds are halides, hydroxides, carbonates, bicarbonates, nitrates, carboxylates (such as acetates, oxalates, citrates and the like). Fluorides and hydroxides of potassium, rubidium and cesium are particularly preferred, especially when the reducing agent is an aldehyde or ketone or carboxylic acid or reducing sugar or zinc or aluminum. Generally, the concentration of the alkali metal compound in the wet-reduction composition and the weight ratio of alkali metal compound to the base catalyst composition are chosen so as to incorporate about 0.05-5 weight-% alkali metal (on an elemental basis) into the catalyst composition. It is also possible to carry out the contacting of the catalyst composition with at least one dissolved alkali metal compound before the wet-reduction or, alternatively, after the wet-reduction has occurred. However, the essentially simultaneous wet-reduction and treatment with at least one alkali metal compound, as described above, is the presently preferred method. It is, of course, also possible (yet presently not preferred) to carry out the contacting with the alkali metal compound(s) both before said wet-reduction and concurrently with said wet-reduction, or both concurrently with said wet-reduction and after said wet-reduction, or before, concurrently with and after said wet-reduction.

**[0010]** The contacting of the supported Pd/Ag base catalyst composition with the wet reduction composition can be carried out in any suitable manner. In general, the catalyst composition and the wet-reduction composition are contacted (mixed) for a time period of at least about 1 second, preferably about 10 seconds to about 10 hours, at a relatively low temperature of about 10-60°C. More preferably, the time period is about 0.02 to about 2 hours, and the temperature is in the range of about 20°C to about 50°C. The pressure during the wet-reduction step is approximately atmospheric (about 0 psig). This contacting step can be carried out as a batch-type operation (mixing or soaking) or continuously (e.g., by using a mixing screw or a static mixer equipped with internal baffles or by spraying the base catalyst composition which is placed on a moving conveyor belt with the wet-reduction composition).

**[0011]** The wet-reduced catalyst composition is then substantially separated from the wet-reduction composition by any conventional solid-liquid separation technique, such as filtering (presently preferred), decanting of the liquid, centrifuging, and the like. Thereafter, the substantially separated, wet-reduced catalyst composition is dried, generally for a time period of about 0.2-20 hours (preferably about 2-6 hours), at a temperature of about 50-150°C (preferably about 100-130°C). It is preferred to then heat (calcine) the dried, wet-reduced catalyst composition, generally for a time period of about 0.2-20 hours (preferably about 1-6 hours) at a temperature of about 300-700°C (preferably about 400-600°C). Both the drying step and the calcining step can be carried out in an oxidizing (i.e.,  $O_2$ -containing) gas atmosphere or in an inert gas atmosphere (e.g., under  $N_2$ , He, Ar, and the like), preferably in air. This calcining step is particularly preferred when an alkali metal hydroxide has been used as the reducing agent.

**[0012]** The thus-prepared catalyst composition which has been dried and, optionally, calcined can then be employed in a process for hydrogenating acetylene to primarily ethylene. Optionally, the catalyst is first contacted, prior to the acetylene hydrogenation, with hydrogen gas or with a gaseous hydrocarbon generally at a temperature in the range of about 30°C to about 100°C, for a time period of about 4 to about 20 hours. During this contacting with  $H_2$  or hydrocarbon(s) before the selective acetylene hydrogenation commences, palladium and silver compounds (primarily oxides) which may be present in the wet-reduced catalyst composition after the drying step and the optional calcining step (described above) are substantially reduced to palladium and silver metal. When this optional reducing step is not carried out, the hydrogen gas present in the reaction mixture accomplishes this reduction of oxides of Pd and Ag during the initial phase of the acetylene hydrogenation reaction of this invention.

**[0013]** The selective hydrogenation process of this invention is carried out by contacting (a) a feed gas which com-

prises acetylene, preferably an ethylene stream containing acetylene as an impurity (generally at a level of about 1 ppm to about 50,000 ppm  $C_2H_2$ ) and (b) hydrogen gas with (c) the catalyst composition(s) of the present invention. In order to best attain substantially complete removal of the acetylene, there should be at least one mole of hydrogen for each mole of acetylene present. Gases (a) and (b) are generally premixed before their contact with the catalyst composition (c). It is within the scope of this invention to have additional gases (such as methane, ethane, propane, propene, butane, butenes, carbon monoxide, hydrogen sulfide) present in the feed gas, as long as they do not significantly interfere with the selective hydrogenation of acetylene to ethylene. Generally, CO and  $H_2S$  are present in trace amounts (preferably less than about 0.5 weight percent CO and less than about 50 ppm  $H_2S$ ).

**[0014]** The temperature necessary for the selective hydrogenation of acetylene to ethylene depends largely upon the activity of the catalysts and the extent of acetylene removal desired. Generally, temperatures in the range of about  $0^\circ C$  to about  $150^\circ C$  are used. Any suitable reaction pressure can be employed. Generally, the total pressure is in the range of about 100 to about 1,000 pounds per square inch gauge (psig). The gas hourly space velocity (GHSV) can also vary over a wide range. Typically, the space velocity will be in the range of about 1,000 to about 10,000  $m^3$  of feed per  $m^3$  of catalyst per hour, more preferably about 2,000 to about 8,000  $m^3/m^3$ /hour.

**[0015]** Regeneration of the catalyst composition can be accomplished by heating the catalyst composition in air (at a temperature which preferably does not exceed about  $700^\circ C$ ) to burn off any organic matter and/or char that has been accumulated on the catalyst composition. Optionally, the oxidatively regenerated composition is reduced with  $H_2$  or a suitable hydrocarbon (as has been described above) before its redeployment in the selective hydrogenation of acetylene. It is also within the scope of this invention to treat the oxidatively regenerated catalyst composition with a wet-reduction composition, followed by a drying step and an optional calcining step (i.e., in accordance with the method of this invention) before the catalyst is redeployed in the selective hydrogenation of acetylene (either directly or after reduction with  $H_2$  or a suitable hydrocarbon, as has been described above).

**[0016]** The following examples are presented to further illustrate this invention and are not to be construed as unduly limiting its scope.

#### Example I

**[0017]** This example illustrates the reduction of supported palladium catalysts with a dissolved alkali metal borohydride and the use of this "wet-reduced" catalyst for the selective hydrogenation of acetylene to ethylene.

Catalyst A1 (Control) was a commercial  $Pd/Al_2O_3$  catalyst which contained 0.018 weight-% Pd and about 99 weight-% alumina. It had a surface area (determined by the BET method employing  $N_2$ ) of 3-5  $m^2/g$ , and had been provided by United Catalysts Inc. (UCI), Louisville, KY under the product designation "G-83A".

Catalyst A2 (Control) was prepared by soaking 20 cc of Catalyst A1 in 150 cc distilled water (which had been deaerated by bubbling  $N_2$  gas through), adding 0.130 grams of  $NaBH_4$  to the catalyst/water mixture, and stirring the entire mixture (containing the catalyst, water and  $NaBH_4$ ) for about 1 hour at room temperature. Then the excess liquid was drained and the soaked catalyst was washed several times with deaerated water. The wet catalyst was heated in a hydrogen gas atmosphere at  $90^\circ C$  for 2 hours, and allowed to cool to room temperature under flowing  $H_2$ .

Catalyst A3 (Control) was prepared by soaking 23.65 grams of Catalyst A1 in 100 cc of methanol (which had been deaerated with flowing  $N_2$ ), adding about 1 gram of solid  $NaBH_4$  to the catalyst/methanol mixture, stirring the entire mixture (containing the catalyst, methanol and  $NaBH_4$ ) for about 1 hour at room temperature, draining excess liquid, washing the soaked catalyst three times with fresh methanol, drying the washed catalyst at  $180^\circ F$  ( $82^\circ C$ ) overnight, and calcining the dried catalyst at  $370^\circ C$  for about 4 hours.

Catalyst B1 (Control) was a commercial  $Pd/Ag/Al_2O_3$  catalyst which contained 0.023 weight-% Pd, 0.065 weight-% Ag and about 99 weight-% alumina. It had a BET/ $N_2$  surface area of 3-5  $m^2/g$ , had been prepared substantially in accordance with the method described in U.S. Patent 4,404,124 (column 4, lines 32-45), and had been provided by UCI (identified above) under the product designation "G-83C".

Catalyst B2 (Invention) was prepared by soaking about 20 cc of Catalyst B1 in 150 cc of deaerated methanol, adding about 1.0 gram of solid  $NaBH_4$  to the catalyst/methanol mixture, stirring the entire mixture (containing the catalyst, methanol and  $NaBH_4$ ) for about 90 minutes at room temperature, draining excess liquid, washing the soaked catalyst three times with deaerated methanol, and drying the washed catalyst under vacuum conditions.

Catalyst B3 (Invention) was prepared by soaking 20 cc of Catalyst B1 in 100 cc deaerated methanol, adding about 1.0 gram of solid  $NaBH_4$  to the catalyst/methanol mixture, stirring the entire mixture (containing the catalyst, methanol and  $NaBH_4$ ) for about 1 hour at room temperature, draining excess liquid, washing the soaked catalyst three times with deaerated methanol, drying the washed catalyst overnight at  $180^\circ F$  ( $82^\circ C$ ), and calcining the dry catalyst at  $370^\circ C$  in air for about 3 hours.

Catalyst B4 (Invention) was prepared by calcining Catalyst B2 after it had been tested for its acetylene hydrogen-

ation performance at 370°C in air for about 4 hours.

[0018] About 20 cc of each of the above-described catalysts was placed into a stainless steel reactor tube having a 0.5 inch inner diameter and a length of about 18 inches. Each catalyst was treated with flowing hydrogen gas under a pressure of 200 psig, at a temperature of about 110-130°F, for about 16 hours. Thereafter, the reactor tube was cooled to about 110°F, and a hydrocarbon-containing feed gas containing 1.98 weight-% hydrogen, 21.40 weight-% methane, 21.18 weight-% ethane, 55.09 weight-% ethylene, 0.35 weight-% acetylene and 0.03 weight-% carbon monoxide was introduced into the reactor tube at a rate of about 900 cc/minute. The reactor temperature was gradually increased to the desired reaction temperature, and samples of the formed product were analyzed by means of a gas chromatograph at various time intervals.

[0019] Two key test results are summarized in Table I:  $T_1$ , which is the "cleanup" temperature at which acetylene is substantially hydrogenated to ethylene (so as to obtain a product containing less than about 10 ppm (ppm = parts per million parts by weight) of acetylene; and  $T_2$ , which is the "runaway" temperature at which a substantial portion of ethylene is converted to ethane (exothermic "runaway" reaction) and the ethylene/ethane molar ratio in the product has decreased to about 2.3 (from about 2.8 attained at lower temperatures). The higher the temperature difference ( $T_1-T_2$ ) attained with a particular catalyst, the more satisfactorily will this catalyst perform as a selective acetylene hydrogenation catalyst. Test results are summarized in Table I.

Table I

Run	Catalyst	$T_1$ (°F)	$T_2$ (°F)	$T_2-T_1$
1 (Control)	A1 (Pd/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	114	143	29
2 (Control)	A2 (Pd/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with NaBH <sub>4</sub> )	116	145	29
3 (Control)	A3 (Pd/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with NaBH <sub>4</sub> , and calcined)	133	164	31
4 (Control)	B1 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	120	155	35
5 (Invention)	B2 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with NaBH <sub>4</sub> )	192	232	40
6 (Invention)	B3 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with NaBH <sub>4</sub> , and calcined)	134	183	49
7 (Invention)	B4 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with NaBH <sub>4</sub> , and calcined)	141	190	49

[0020] Test results in Table I show that wet-reduction of a Pd/Al<sub>2</sub>O<sub>3</sub> catalyst with dissolved sodium borohydride, either with or without subsequent calcination, had no significant effect on  $T_2-T_1$  (i.e., the temperature difference defined above). On the other hand, the wet-reduction of the Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalyst resulted in an enhanced temperature difference, in particular when calcination in air was carried out after the wet-reduction. The presence of traces of formed C<sub>4</sub> hydrocarbons (about 0.02 weight-%) in the hydrogenation product was observed.

#### Example II (Control)

[0021] This example illustrates the wet-reduction of a supported palladium/silver catalyst with dissolved hydrazine in accordance with this invention.

Catalyst C1 (Control) was substantially the same as Catalyst B1 described in Example I.

Catalyst C2 (Control) was prepared by soaking 23.3 grams of Catalyst C1 with a solution of 5 cc N<sub>2</sub>H<sub>4</sub>•H<sub>2</sub>O in 45 cc of distilled water for about 1 hour. The excess liquid was poured off, and the wet catalyst was heated in a forced air convection oven at 125°C for about 4 hours.

[0022] Both catalysts were tested for their selective acetylene hydrogenation activity, substantially in accordance with the procedure described in Example I, except that the hydrocarbon-containing feed contained about 33.2 weight-% methane, about 0.08 weight-% ethane, about 63.1 weight-% ethylene, about 0.35 weight-% acetylene about 0.05 weight-% carbon monoxide, and about 3.2 weight-% H<sub>2</sub>. Test results are summarized in Table II.

Table II

Run	Catalyst	$T_1$ (°F)	$T_2$ (°F)	$T_2-T_1$	ppm Ethane Formed at $T_1$
8 (Control)	C1 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	107	145	38	2970

Table II (continued)

Run	Catalyst	T <sub>1</sub> (°F)	T <sub>2</sub> (°F)	T <sub>2</sub> -T <sub>1</sub>	ppm Ethane Formed at T <sub>1</sub>
9 (Control)	C2 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with N <sub>2</sub> H <sub>4</sub> )	123	166	43	2290

[0023] Test data in Table II show that wet-reduction of a Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalyst was beneficial in terms of increasing the temperature difference T<sub>2</sub>-T<sub>1</sub> (defined in Example I). The presence of trace amounts of formed butenes (0.03-0.05 weight%) in the hydrogenation product was observed.

[0024] Table II also presents test data on the amount (in ppm by weight) of ethane produced at the "cleanup" temperature, T<sub>1</sub>, which is a measure of the selectivity to ethylene exhibited by a particular catalyst at the "cleanup" temperature (defined in Example I). These test data were obtained by subtracting the amount of ethane present in the feed from the amount of ethane present in the hydrogenation product produced at T<sub>1</sub>. Table II clearly shows that less of the undesirable ethane was formed with the wet-reduced catalyst, C<sub>2</sub> (as compared with the untreated Catalyst C<sub>1</sub>). Consequently, more desirable ethylene was produced with the invention Catalyst C<sub>2</sub> (as compared with the untreated Catalyst C<sub>1</sub>).

### Example III

[0025] This example illustrates the wet reduction of a Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalyst with formaldehyde in the presence of an alkali metal hydroxide, in accordance with this invention.

Catalyst D1 (Invention) was prepared by mixing 20 cc of control Catalyst B1 (described in Example I) with about 110 cc of a solution which contained about 38 weight-% formaldehyde, about 12 weight-% methanol and about 50 weight-% water, and 1.13 grams of NaOH. The entire mixture was stirred at room temperature for about 2 hours, excess liquid was poured off, the soaked catalyst was rinsed three times with fresh methanol, the washed catalyst was dried overnight at about 88°C, and the dried catalyst was then calcined in air at 370°C for 4.5 hours.

Catalyst D2 (Invention) was prepared by mixing 20 cc of control Catalyst C1 (described in Example II) with 110 cc of a solution, which contained about 37 weight-% formaldehyde, about 17 weight-% methanol and about 46 weight-% water, and 1.18 grams of NaOH. The entire mixture was stirred at room temperature for about 2 hours. Excess liquid was poured off. The wet catalyst was rinsed three times with 150 cc of fresh methanol, and dried under H<sub>2</sub> at 60-100°C for several hours.

Catalyst D3 (Invention) was prepared by mixing 20 cc of Catalyst C1 with 75 cc of a solution, which contained about 37 weight-% formaldehyde, about 17 weight-% methanol and about 46 weight-% water, and about 0.6 gram of KOH. The entire mixture was stirred at room temperature for about 40 minutes, excess liquid was poured off, the wet catalyst was dried at about 88°C, and was then calcined at 200°C for several hours.

[0026] The thus-prepared catalysts were tested for the selective acetylene hydrogenation activity, substantially in accordance with the procedure described in Example I. The hydrocarbon-containing feed had essentially the same composition as the feed employed in the tests of Example I. Test results for the three catalysts described in this Example are summarized in Table III. Also included in this table are the test results from control Run 4 (see Table I) employing control Catalyst B1 (for comparison with Run 10 employing invention Catalyst D1). Results from another control run (Run 11 employing Catalyst C1) is listed for comparison with invention Catalysts D2 and D3 (Runs 12 and 13).

Table III

Run	Catalyst	T <sub>1</sub> (°F)	T <sub>2</sub> (°F)	T <sub>2</sub> -T <sub>1</sub>
4 (Control)	B1 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	120	155	35
10 (Invention)	D1 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of NaOH, and calcined)	125	171	46
11 (Control)	C1 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	134	167	33
12 (Invention)	D2 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of NaOH),	129	182	53
13 (Invention)	D3 Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH, and calcined)	143	209	66

[0027] Test results in Table III clearly show that wet-reduction of a Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalyst with formaldehyde in the presence of an alkali metal hydroxide (with or without subsequent calcination) was quite effective in increasing the temperature difference T<sub>2</sub>-T<sub>1</sub> (defined in Example I). The presence of trace amounts of C<sub>4</sub> hydrocarbons (0.01-0.02 weight-%) in the hydrogenation product was observed.

#### Example IV

[0028] This example illustrates the wet-reduction of supported palladium catalysts with formaldehyde in the presence of alkali metal compounds and the performance of these materials as catalysts in the selective hydrogenation of acetylene.

Catalyst E1 (Control) was a commercial "G-83A" Pd/Al<sub>2</sub>O<sub>3</sub> catalyst, described in Example I (Catalyst A1).

Catalyst E2 (Control) was prepared by soaking, with occasional stirring, 30 grams of Catalyst E1 with a solution of 0.42 gram of 88 weight-% KOH pellets in 26 grams of distilled water for about 1 hour at room temperature, followed by draining excess solution, drying for 16 hours at 125°C, and calcining in air for 2 hours at 1000°F (538°C).

Catalyst E3 (Control) was prepared in accordance with the procedure for Catalyst E2, except that Catalyst E1 was soaked with a mixture of 0.42 gram of 88% KOH pellets and 26 grams of a commercially available formaldehyde solution containing 38 weight-% CH<sub>2</sub>O, 12 weight-% CH<sub>3</sub>OH and 50 weight-% H<sub>2</sub>O.

Catalyst E4 (Control) was a commercial "G-83C" Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalyst described in Example I (Catalyst B1).

Catalyst E5 (Control) was prepared by soaking, with occasional stirring, 30 grams of Catalyst E4 with a solution of 0.48 gram of 88% KOH pellets in 26 grams of water for about 1 hour at room temperature, followed by draining excess solution, drying for 8 hours at 125°C, and calcining in air for 2 hours at 1000°F (538°C).

Catalyst E6 (Invention) was prepared in accordance with the procedure for Catalyst E5, except that Catalyst E4 was soaked with a mixture of 0.48 gram of 88% KOH pellets and 26 grams of the above-described formaldehyde solution.

[0029] Catalysts E1 through E6 were tested substantially in accordance with the procedure described in Example I. Each catalyst had been preheated for 1 hour with flowing hydrogen gas at 37.8°C/1.38 MPa (100°F/200 psig) and then for 1 hour with the hydrocarbon-containing feed (containing methane, ethane, ethylene, acetylene, carbon monoxide and hydrogen) at 37.8°C/1.38 MPa (100°F/200 psig). Thereafter, the temperature was gradually raised while the feed passed through the reactor. Test results are summarized in Table IV.

Table IV

Run	Catalyst	T <sub>1</sub> (°F)	T <sub>2</sub> (°F)	T <sub>2</sub> -T <sub>1</sub>	ppm Ethane Formed at T <sub>1</sub>
14 (Control)	E1 (Pd/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	115	134	19	8850
15 (Control)	E2 (Pd/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced but treated with KOH, calcined)	128	181	53	3400
16 (Control)	E3 (Pd/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH, calcined)	135	186	51	3440
17 (Control)	E4 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	110	158	48	1830
18 (Invention)	E5 Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced but treated with KOH, calcined)	123	190	67	1900
19 (Invention)	E6 Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH, calcined)	133	211	78	840

[0030] Test data in Table IV show that wet-reduction of a Pd/Al<sub>2</sub>O<sub>3</sub> catalyst (without Ag) with formaldehyde in the presence of an alkali metal compound (KOH) showed no improvement (in terms of T<sub>2</sub>-T<sub>1</sub> and of ethane formed at T<sub>1</sub>) over treatment with KOH alone (compare Run 16 with Run 15).

#### Example V

[0031] This example further illustrates a particularly preferred feature of this invention: The use of Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalysts that were wet-reduced with formaldehyde in the presence of alkali metal compounds.

Catalyst F1 (Control) was a commercial "G-83C" Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalyst (essentially the same as Catalyst B1, Example I).

Catalyst F2 (Control) was a "G-83C" Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalyst (defined above) which had been used for the selective hydrogenation of acetylene to ethylene in a Texas refinery of Phillips Petroleum Company, and had then been regenerated by heating it in air to a temperature of 1000°F within a time period of 3 hours, followed by calcining in air at that temperature for 4 hours. Thereafter, the calcined, used catalyst was cooled to room temperature.

Catalyst F3 (Invention) was prepared as follows 0.51 gram of 88 weight-% KOH pellets (equivalent to 0.008 mole KOH) was added to 30 grams of a 37-38 weight-% formaldehyde solution in methanol. The formed solution was stirred for about one minute, 30 grams of control Catalyst F2 (regenerated "G-83C") were added to the solution, and the obtained mixture was kept at room temperature for 1 hour, with occasional stirring. Then excess liquid was decanted, the soaked tablets were dried in air at 125°C for 5 hours, and the dried tablets were calcined in air at 538°C for 2 hours.

Catalyst F4 (Invention) was prepared essentially in accordance with the above-described procedure for Catalyst F3 except that 0.97 gram of 99% pure RbOH·H<sub>2</sub>O (0.008 mole RbOH) was used (in lieu of 0.008 mole KOH).

Catalyst F5 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 except that 0.008 mole CsOH was used (in lieu of 0.008 mole KOH).

Catalyst F6 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 except that Catalyst F1 (fresh "G-83C") was used as the starting material (in lieu of Catalyst F2).

Catalyst F7 (Invention) was prepared essentially in accordance with Catalyst F4 except that Catalyst F1 was used as the starting material (in lieu of Catalyst F2).

Catalyst F8 (Invention) was prepared essentially in accordance with the procedure for Catalyst F5 except that Catalyst F1 was used as the starting material (in lieu of Catalyst F2).

Catalyst F9 (Invention) was prepared essentially in accordance with the procedure for Catalyst F6 except that 0.002 mole KOH was employed (in lieu of 0.008 mole KOH).

Catalyst F10 (Invention) was prepared essentially in accordance with the procedure for Catalyst F7 except that 0.002 mole RbOH was employed (in lieu of 0.008 mole RbOH).

Catalyst F11 (Invention) was prepared essentially in accordance with the procedure for Catalyst F8 except that 0.002 mole CsOH was employed (in lieu of 0.008 mole CsOH).

Catalyst F12 (Invention) was prepared essentially in accordance with the procedure for Catalyst F6 except that 0.032 mole of KOH was employed (in lieu of 0.008 mole of KOH).

Catalyst F13 (Invention) was prepared essentially in accordance with the procedure for Catalyst F12 except that 0.032 mole of NaOH (in lieu of KOH) was employed.

Catalyst F14 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 except that 0.005 mole of KOH was employed (in lieu of 0.008 mole KOH).

Catalyst F15 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 except that 0.0275 mole of KOH was employed (in lieu of 0.008 mole KOH), the time of contact with the formaldehyde solution was only about 0.5 hour (in lieu of 1 hour), and the formaldehyde concentration was only about 18 weight-% (in lieu of 37-38%).

Catalyst F16 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 except that 0.015 mole of KOH was employed (in lieu of 0.008 mole KOH), and the formaldehyde concentration was only about 1 weight% (in lieu of 37-38%).

Catalyst F17 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 except that 0.050 mole of KOH was employed (in lieu of 0.008 mole of KOH).

Catalyst F18 (Invention) was prepared essentially in accordance with the procedure for Catalyst F6 except that 0.05 mole of KF was employed (in lieu of 0.008 mole of KOH).

Catalyst F19 (Invention) was prepared essentially in accordance with the procedure for Catalyst F18, except that 0.007 mole of KF and 0.001 mole of KOH (in lieu of 0.008 mole KF) was employed.

[0032] Catalysts F1 through F19 were tested substantially in accordance with the procedure described in Example I, except that a hydrocarbon feed which was essentially the same as that described in Example II was employed. Test results are summarized in Table V.

Table V

Run	Catalyst	T <sub>1</sub> (°F)	T <sub>2</sub> (°F)	T <sub>2</sub> -T <sub>1</sub>	ppm Ethane Formed at T <sub>1</sub>
20 (Control)	F1 (fresh Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	125	169	44	4320
21 (Control)	F2 (regenerated Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	139	176	37	3950
22 (Invention)	F3 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	141	230	89	760
23 (Invention)	F4 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of RbOH)	159	235	76	1650
24 (Invention)	F5 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of CsOH)	177	290	113	700
25 (Invention)	F6 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	147	231	84	750
26 (Invention)	F7 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of RbOH)	158	260	102	572
27 (Invention)	F8 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of CsOH)	188	289	101	800
28 (Invention)	F9 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	146	218	72	1170
29 (Invention)	F10 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of RbOH)	147	227	80	840
30 (Invention)	F11 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of CsOH)	158	237	79	670
31 (Invention)	F12 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	146	266	120	579
32 (Invention)	F13 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of NaOH)	149	203	54	2350
33A (Invention)	F14 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	145	212	67	1250
33B (Invention)	F14 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	147	209	62	1200
34 (Invention)	F15 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	149	237	88	540
35 (Invention)	F16 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	141	241	100	350
36 (Invention)	F17 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	151	238	87	480
37 (Invention)	F18 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O, in presence of KF)	161	294	133	500
38 (Invention)	F19 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with CH <sub>2</sub> O, in presence of KF+KOH)	136	233	97	780

[0033] Test data in Table V clearly show that the reduction of fresh or of used, regenerated Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalysts with formaldehyde in the presence of an alkali metal compound consistently resulted in higher T<sub>2</sub>-T<sub>1</sub> values and in lower amounts of ethane formed at the cleanup temperature, T<sub>1</sub>. Most effective alkali metal compounds were KOH, KF, RbOH and CsOH. Generally, the use of formaldehyde solutions containing 0.002-0.050 mole KOH or RbOH or

CsOH or KF were most effective. Additional test data (not included in Table V) indicate that the amounts of ethane produced at temperatures which were 10°F, 20°F and 30°F, respectively, above the particular "cleanup" temperature were consistently lower in invention runs 22-38 than in control runs 20 and 21. Thus, the wet-reduced, alkali-metal-promoted Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalysts were more selective to ethylene (rather than ethane) than the untreated catalysts, at comparable conversions of acetylene.

#### Example VI

[0034] This example illustrates wet-reduction of Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalysts with a dissolved reducing agent other than formaldehyde, in the presence of an alkali metal compound (KOH).

Catalyst G1 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 (Example V) except an aqueous solution containing 0.03 mole of formic acid and 28.5 grams of water was used as the reducing agent (in lieu of formaldehyde/methanol/water).

Catalyst G2 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 (Example V) except that an aqueous solution containing 0.03 mole of ascorbic acid (Vitamin C) and 24.7 grams of water was used as the reducing agent (in lieu of formaldehyde/methanol/water).

Catalyst G3 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 (Example V) except that an aqueous solution containing 0.03 mole of hydrazine hydrate and about 29.0 grams of water was used as the reducing agent (in lieu of formaldehyde/methanol/water).

Catalyst G4 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 (Example V) except that an aqueous solution containing 0.03 mole of dextrose and 24.6 grams of water was used as the reducing agent (in lieu of formaldehyde/methanol/water).

Catalyst G5 (Invention) was prepared essentially in accordance with the procedure for Catalyst G4 except that 0.003 mole dextrose (in lieu of 0.03 mole dextrose) and 0.025 mole KOH was employed (in lieu of 0.005 mole KOH).

Catalyst G6 (Invention) was prepared essentially in accordance with the procedure for Catalyst G5 except that 0.015 mole KOH was employed (in lieu of 0.025 mole KOH).

Catalyst G7 (Invention) was prepared essentially in accordance with the procedure for Catalyst F3 (Example V) except that a mixture of 0.38 grams of aluminum metal powder, 0.96 grams of KOH and 20 grams of water was used as the reducing agent (in lieu of formaldehyde/methanol/water).

[0035] Catalysts G1-G7 were tested substantially in accordance with the procedure used in Example V. Test results are summarized in Table VI.

Table VI

Run	Catalyst	T1 (°F)	T2 (°F)	T <sub>2</sub> -T <sub>1</sub>	ppm Ethane Formed at T <sub>1</sub>
21 (Control)	F2 (regenerated Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , not wet-reduced)	139	176	37	3950
39 (Invention)	G1 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with formic acid, in presence of KOH)	137	207	70	894
40 (Invention)	G2 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with ascorbic acid, in presence of KOH)	132	216	84	630
41 (Invention)	G3 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with hydrazine, in presence of KOH)	138	229	91	550
42 (Invention)	G4 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with dextrose, in presence of KOH)	143	210	67	1300
43 (Invention)	G5 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with dextrose, in presence of KOH)	144	265	121	350
44 (Invention)	G6 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with dextrose, in presence of KOH)	141	241	100	750
45 (Invention)	G7 (Pd/Ag/Al <sub>2</sub> O <sub>3</sub> , wet-reduced with Al, in presence of KOH)	181	298	117	-

[0036] A comparison of the test data in Table VI with those in Table V indicate that the four reducing agents employed in this Example were essentially as effective as formaldehyde, in the presence of potassium hydroxide.

#### Example VII

[0037] This example illustrates that the wet-reduction of supported Pd/Ag catalysts containing inorganic supports other than alumina (namely titania and zirconia) was also quite effective in increasing  $T_2-T_1$  values in the selective hydrogenation of acetylene, in accordance with this invention.

Catalyst H1 (Control) was a Pd/Ag/TiO<sub>2</sub> catalyst which was prepared by impregnating 1/8 inch, sulfur-free titania pellets with an aqueous palladium(II) nitrate solution (so as to provide a level of about 0.02 weight-% Pd on the TiO<sub>2</sub> pellets), drying the Pd/TiO<sub>2</sub> particles, calcining them for 8 hours at 400°C in air, impregnating the calcined Pd/TiO<sub>2</sub> particle with an aqueous silver nitrate solution (so as to provide a level of about 0.1 weight-% Ag in the catalyst), drying the Pd/Ag/TiO<sub>2</sub> catalyst particles, and then calcining them for 8 hours at 400°C in air.

Catalyst H2 (Invention) was prepared by soaking Catalyst H1 with a mixture of 26.0 grams of the commercial formaldehyde/methanol/water solution described in Example IV (see preparation of Catalyst E3) and 0.41 grams of 88 weight-% KOH pellets, followed by draining excess solution, drying (at 125°C, for 5 hours) and calcining in air for 2 hours at 400°C.

[0038] Both catalysts were tested substantially in accordance with the procedure described in Example I, except that a hydrocarbon-containing feed similar to the one described in Example II was used. Test results are summarized in Table VII.

Table VII

Run	Catalyst	T1 (°F)	T2 (°F)	T2-T1	ppm Ethane Formed at T <sub>1</sub>
46 (Control)	H1 (Pd/Ag/TiO <sub>2</sub> , not wet-reduced)	127	167	40	3900
47 (Invention)	H2 (Pd/Ag/TiO <sub>2</sub> , wet-reduced with CH <sub>2</sub> O in presence of KOH)	126	191	65	1100

[0039] Test data in Table VII clearly show that wet-reduction of Pd/Ag/TiO<sub>2</sub> had essentially the same beneficial effects as wet-reduction of Pd/Ag/Al<sub>2</sub>O<sub>3</sub> (described in previous examples)

[0040] Additional preliminary tests (not described in detail herein) indicate that the use of a Pd/Ag/ZrO<sub>2</sub> catalyst (which had not been wet-reduced in the selective hydrogenation of acetylene) was almost as effective (in terms of  $T_2-T_1$  values) as Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalysts (also not wet-reduced). Based on these preliminary test results, it is concluded that the wet-reduction of Pd/Ag/ZrO<sub>2</sub> catalysts, with or without the presence of alkali metal compounds, in accordance with this invention will produce catalysts exhibiting enhanced  $T_2-T_1$  values and higher selectivities to ethylene (as compared with the untreated catalysts).

#### Example VIII

[0041] This example illustrates a method of preparing an effective acetylene hydrogenation catalyst by wet-reduction and subsequent promotion with potassium fluoride.

[0042] Catalyst I (Invention) was prepared by soaking 23.3 grams of Catalyst B1 ("G-83C", described in Example I) in 30 cc of a 37 weight-% formaldehyde solution (described in Example III for Catalyst D2), adding about 0.5 gram solid KOH to the catalyst/solution mixture, stirring this mixture for 30 minutes at room temperature, adding again about 0.5 gram of solid KOH, and stirring the obtained mixture again for about 30 minutes at room temperature. Thereafter, excess liquid was drained, and the soaked, wet-reduced mixture was washed twice with fresh methanol and then twice with distilled water (so as to remove substantially all KOH which had been incorporated into the catalyst). The washed, wet-reduced catalyst was dried overnight at 180°F, and then soaked with a solution of 0.355 gram anhydrous potassium fluoride in 7.58 grams of water. The KF-impregnated catalyst was dried overnight at 180°F and calcined for 1.5 hours in air at 370°C.

[0043] The thus obtained catalyst, which contained about 1 weight-% K (as fluoride), was tested for its acetylene hydrogenation activity substantially in accordance with the procedure described in Example I. Result:  $T_1$  was 154°F,  $T_2$  was 245°F, and  $T_2-T_1$  was 91°F.

[0044] Thereafter, the catalyst was exposed to the feed at "runaway" conditions, i.e., at a temperature in excess of 245°F, for about 22 minutes, so as to simulate possible damage to the catalyst by a "runaway" reaction in a plant operation. Then the catalyst was tested again (after lowering the temperature of the reactor while H<sub>2</sub> gas passed through). Result: T<sub>1</sub> was 161°F, T<sub>2</sub> was 259°F, and T<sub>2</sub>-T<sub>1</sub> was 98°F. This result clearly indicates that no adverse effect on the KF-promoted, wet-reduced Pd/Ag/Al<sub>2</sub>O<sub>3</sub> catalyst had occurred by this exposure to "runaway" conditions.

[0045] Reasonable variations, modifications and adaptations for various usages and conditions can be made within the scope of the disclosure and the appended claims, without departing from the scope of this invention.

## 10 Claims

1. A process for selectively hydrogenating acetylene with hydrogen gas to ethylene, characterized in that the process is carried out in the presence of a catalyst composition, containing

- a) palladium
- b) silver
- c) at least one alkali metal, and
- d) a solid support material.

2. The process of claim 1, wherein said acetylene is present as an impurity in an ethylene stream, at a level of 1-50.000 ppm C<sub>2</sub>H<sub>2</sub>.

3. The process of claims 1 or 2 being carried out at a reaction temperature of 0-150°C.

4. The process of one of the claims 1 to 3, where the catalyst composition contains silver and palladium in a weight ratio of 2.8 : 1 to 8 : 1.

## Patentansprüche

1. Verfahren zur selektiven Hydrierung von Acetylen mit Wasserstoffgas zu Ethylen, dadurch gekennzeichnet, daß das Verfahren in Gegenwart einer Katalysatorzusammensetzung durchgeführt wird, enthaltend

- a) Palladium
- b) Silber
- c) mindestens ein Alkalimetall, und
- d) ein festes Trägermaterial.

2. Verfahren nach Anspruch 1, wobei das Acetylen als Verunreinigung in einem Ethylenstrom in einer Konzentration von 1 bis 50 000 ppm C<sub>2</sub>H<sub>2</sub> vorhanden ist.

3. Verfahren nach den Ansprüchen 1 oder 2, das bei einer Reaktionstemperatur von 0 bis 150 °C durchgeführt wird.

4. Verfahren nach einem der Ansprüche 1 bis 3, wobei die Katalysatorzusammensetzung Silber und Palladium in einem Gewichtsverhältnis von 2,8:1 bis 8:1 enthält.

## R vendications

1. Un procédé pour hydrogéner sélectivement de l'acétylène avec de l'hydrogène gazeux en éthylène, caractérisé en ce que le procédé est mis en oeuvre en présence d'une composition de catalyseur renfermant :

- a) du palladium
- b) de l'argent
- c) au moins un métal alcalin, et
- d) un matériau de support solide.

2. Le procédé selon la revendication 1, dans lequel ledit acétylène est présent sous la forme d'une impureté dans

## EP 0 689 872 B1

un courant d'éthylène à un taux de 1-50 000 ppm de  $C_2H_2$ .

3. Le procédé selon les revendications 1 ou 2 qui est mis en oeuvre à une température de réaction de 0 à 150°C.

5 4. Le procédé selon l'une des revendications 1 à 3, dans lequel la composition de catalyseur renferme de l'argent et du palladium dans un rapport pondéral de 2,8:1 à 8:1.
